

## **ENTERPRISE PROJECT PROPOSAL**

# **Enterprise Hospitality, Restaurant & Food Delivery Management Platform**

**Issued To:** Development Team, AI-Powered Software Engineering (Batch 26/4 & 26/5), ICT Bangladesh

**Issued By:** International Hospitality Group

**Project Timeline:** 1 August – 30 September 2026

# Enterprise Hospitality, Restaurant & Food Delivery Management Platform

## Project Overview

International Hospitality Group runs hotels, restaurants, and a food delivery service, but right now these run separately with a lot of manual work. This leads to repeated data entry, mixed-up inventory, poor communication between teams, slow reports, and little visibility into how the business is really doing. It costs more, slows staff down, and can hurt the guest experience.

We're proposing one connected system that brings hotel operations, restaurant operations, and food delivery together in one place. With everything centralized, managers get a clearer view of the business, staff can work more efficiently, and customers get faster, more consistent service — whether they're staying at the hotel, dining in, or ordering delivery.

A clear brand look — consistent colors and a logo used everywhere guests interact with the business — will make the experience feel more professional and trustworthy.

We'll know this project succeeded if it makes daily operations simpler, helps teams work together better, improves customer satisfaction, boosts staff productivity, and gives leadership better information for decisions. The first version will cover the core system, but it's being built so we can later add smart, AI-powered features such as chat support for guests and customers, and personalized room and food recommendations.

## Current Business Challenges

- Manual, paper-based or spreadsheet-based operations across departments
- Hotel, restaurant, and delivery running as separate, disconnected systems
- Repeated/duplicate data entry
- Inventory mismatches between kitchen, restaurant, and hotel stock
- Slow, delayed reporting — management doesn't get real-time visibility
- Miscommunication between reception, kitchen, and delivery staff
- Inconsistent guest experience across channels

## Business Objectives

The proposed solution should achieve the following business objectives:

- Bring hotel, restaurant, and food delivery operations together into one connected platform.
- Keep all business information in one central place instead of scattered across systems.
- Reduce manual work by automating routine tasks and workflows.
- Prevent duplicate or mismatched data so records stay accurate and consistent.
- Give each type of user (staff, managers, admins) secure access to only what they need.
- Be built to last and grow, so new features can be added easily as the business expands.

## Stakeholders

- Business Owner / Management
- General Manager
- Reception / Front Desk Staff
- Housekeeping Staff
- Restaurant & Kitchen Staff
- Delivery Staff
- Hotel Guests
- Restaurant & Delivery Customers

## Business Processes

- **Hotel:** Guest books a room → Reception confirms → Guest checks in → Housekeeping prepares room → Guest checks out → Invoice generated
- **Restaurant:** Customer reserves table → Waiter takes order → Kitchen prepares food → Customer pays bill
- **Delivery:** Customer places order → Restaurant prepares food → Delivery assigned → Food delivered to customer

## **Platform Features & Services**

### **Hotel Management**

- Managing room availability and details
- Booking rooms for guests
- Guest check-in
- Guest check-out
- Housekeeping and room cleaning schedules
- Guest billing and invoices
- In-room service requests (food, cleaning, amenities)

### **Restaurant Management**

- Booking tables for diners
- Taking dine-in orders
- Sending orders to the kitchen and tracking preparation
- Assigning and tracking waiter duties
- Updating menu items and prices
- Generating bills for dine-in customers

### **Online Food Delivery**

- Customers creating an account
- Customers placing delivery orders
- Tracking and managing delivery orders
- Viewing past orders

### **Shared Features (used across all three systems)**

- Secure login for staff and customers
- Managing staff accounts and access levels
- Tracking stock and supplies
- Processing payments (demo/test mode for this phase)
- An overview dashboard for managers
- Business performance reports
- Automatic email updates
- Instant in-app alerts

### **Upcoming features (Optional)**

- AI-powered chat support for guest and customer questions.
- Personalized room recommendations.
- Personalized food/menu recommendations.

## Brand Identity

A consistent visual identity should be applied across the platform, guest-facing materials, and signage. The following colors are recommended as the foundation:

### Primary color — Deep navy

HEX #1F3A5F | RGB 31, 58, 95

Use for the logo, headers, navigation bars, footers, and primary buttons. Signals trust, professionalism, and premium hospitality.

### Secondary color — Vibrant red

HEX #FF2147 | RGB 255, 33, 71

Use for call-to-action buttons ("Order now," "Book table"), highlights, offers, and icons. Adds energy and appetite appeal — a common, proven choice in restaurant and food delivery apps.

## Business Constraints

- The system must be easy for non-technical staff to use.
- Daily business operations must continue uninterrupted during system rollout/upgrades.
- Guest and customer data must remain confidential and secure.
- The solution must be able to support future business growth without a full rebuild.

## Risks

- Staff resistance to adopting a new system
- Incomplete or inconsistent data migration from old records
- Additional time needed for staff training
- Temporary operational disruption during rollout

## Development Expectations

We expect the development team to deliver the platform with the following engineering standards in place:

- A well-planned technical structure that runs smoothly today and scales as the business grows.
- The system design must reflect how our hotel, restaurant, and delivery operations actually work.
- Accurate, well-organized storage for bookings, orders, inventory, and guest records.
- A clear data model showing how guests, rooms, orders, and staff records relate to each other.
- Secure login so only verified users can access the platform.
- Permission levels so each employee (front desk, kitchen staff, manager, admin) only sees what's relevant to their job.
- Business rules — pricing, discounts, and booking policies implemented exactly as our business operates.
- Testing — the system must be properly tested before handover.
- Deployment — the solution must be deployed and ready for real use, with a clear deployment guide.
- UI/UX design — the interface should feel clean, modern, and easy to use, similar in style and layout to the following reference designs:
  - Restaurant Website UI Template:  
<https://www.figma.com/design/bvmhHQKj4DUHcKqYuulAiM/Restaurant-Website-UI-Template--Community->
  - Food App Design UI Template:  
<https://www.figma.com/design/EtrLYrPUOkoNqIdNoNynaN/Food-App-Design-UI-Template--Community->
- User manual — a simple, step-by-step user guide must be provided, explaining how staff and managers use each part of the system (hotel, restaurant, delivery, admin dashboard), written in plain, non-technical language.

## Success Criteria

- Reduced manual work and paperwork
- Faster, more consistent customer service
- Better, real-time reporting for management
- Fewer data entry errors
- Higher customer satisfaction
- Easier coordination across departments

## Assumptions

- Staff will receive training on the new system before go-live.
- Reliable internet connectivity will be available at all locations.
- Business processes may evolve during development and require minor adjustments.
- Existing manual/paper records may be migrated into the system at a later stage.

## **Deliverable Acceptance**

- All agreed business modules are completed and functioning.
- Core business processes (booking, ordering, delivery, billing) work correctly end-to-end.
- Staff can perform daily operations using the system without external help.
- User manual and documentation are provided in plain language.
- Management reviews and approves the final demonstration before acceptance.

## **Expected Outcome**

A professional, enterprise-style software solution that demonstrates real integration between hotel, restaurant, and delivery operations — with reliable data, secure access, clear documentation, and a system ready to be deployed and used.
